

UNIVERSITÄT ZU LÜBECK

# Human-Centered Trustworthy AI

Project: Concept

**Rebecca von Engelhardt**

# General Information

## Organisational Aspects

- The project runs during the semester and is expected to end before the examination phase.
- You will receive a grade only for the project report (not the video exposé), which will count as your grade for this part of the module.

## Content and Goal

- You are required to plan, implement, carry out and analyse a short study as part of a project during the semester.
- You should focus on one aspect that is discussed during the lecture and come up with a research question.
- You will be given an environment in which you can make changes to test different ideas.

⇒ Please use the **Moodle forum** if you have any kind of (technical or concept related) questions

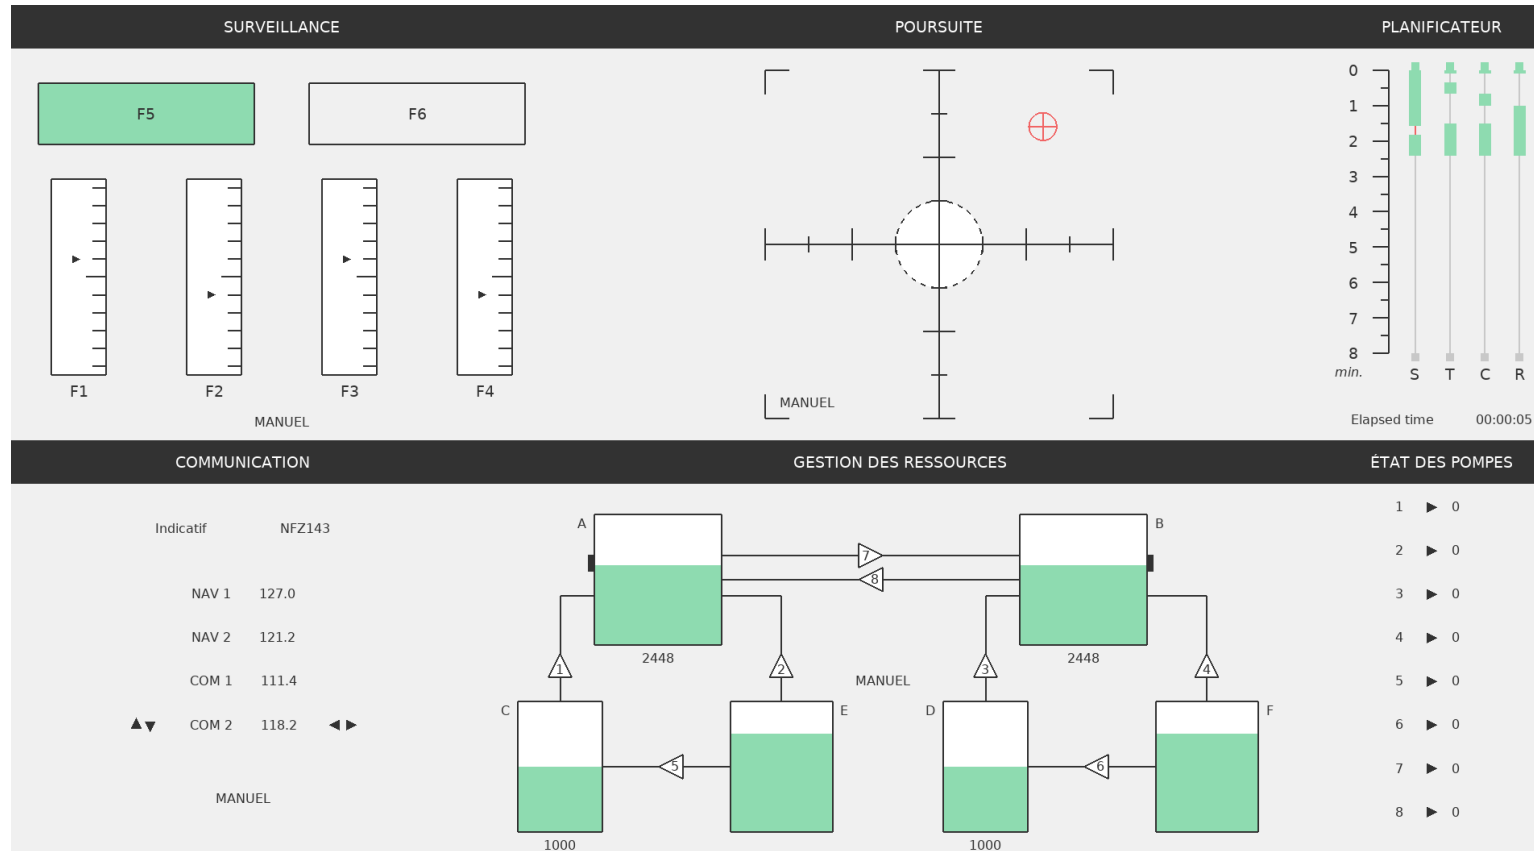

# Our Expectations

The aim is not to train you to become experts in study design, implementation and evaluation.

## **The aim is rather...**

- ... that you develop a feeling for the fact that different system behaviour is perceived differently and
- ... that you gain experience with regard to such system behaviour, changes in a system, availability of information, and other factors that might influence the perceived trustworthiness as well as
- ... get an idea which concepts play a role and how different aspects could be tested.

# OpenMATB (Open Source)

- **Multitasking (or task switching):** Different tasks that need to be handled in parallel
- **Idea:** Get an idea what might influence the perceived trustworthiness of such a system that human (need to) interact with and make some changes to test the effect

... There will be a meeting or video where the idea behind MATB will be presented in more detail

# Steps

1. **Find a group** (2-3 people)
2. **Choose a topic** discussed during the lecture
3. Define your concrete **research question**
4. Come up with a **study plan** how to test your research question  
*--- at this point you should upload a short video (max. 5min) explaining your concept ---*
5. **Implement** your idea
6. **Test some participants** (e.g. other students, friends)
7. **Analyse your data** (be careful with interpretations due to probably small sample sizes!)  
*--- hand in a project report ---*

# Rough (Preliminary) Schedule

- **As soon as possible (end of April?):** Find a group (2-3 people)

Note: We expect you to find a group by yourself. If you tried but still have problems, get in contact with us. Please do so early enough. Once the project started, it might be difficult to integrate in an already ongoing group work.

- **End of April:** Ideas, framework and rough requirements of the project will be presented
- **Beginning of May:** Technical details and information regarding the study design will be presented

*--- develop a concept, research question, ideas for the implementation, test the environment ---*

- **End of May / beginning of June:** Upload a short video explaining your concept

Note: These videos will be uploaded in Moodle and we expect to watch the videos of the other groups to also compare and discuss different approaches in your final report. We will also give some feedback.

*--- implementation, data collection, analysis ---*

- **Mid of July:** Hand in the final report

# Next Steps and Information

**Within the next weeks, you will receive more information...**

- Content regarding MATB
- Technical details of the environment
- Requirements for the exposé and report
- Study design and implementation, research questions, data analysis

**Already available...**

- Additional information (e.g. article about MATB) in Moodle

# Thank you for your attention!
