

An Example Paper Template for Overleaf: Two-Column APA 7 Style with Highlighted Abstract

Rebecca von Engelhardt¹ and Nele Rußwinkel¹

¹Institute of Information Systems, University of Lübeck, Lübeck, Germany
rebecca.engelhardt@uni-luebeck.de, nele.russwinkel@uni-luebeck.de

Introduction: Brief overview of the problem domain and motivation. **Methods:** Description of participants, materials, procedure, and analysis. **Results:** Key findings summarised with figures/tables. **Discussion:** Short summary, interpretation of results and connection to prior literature. **Conclusion:** Main insights and implications for future work.

Keywords: Explainability, Human-Aware AI, Cognitive Modelling, Trustworthiness

1. Introduction

The introduction outlines the motivation, relevance, and structure of the paper. Citations should be in APA7, e.g.: Research on *explainable artificial intelligence* (XAI) has highlighted the importance of interpretability for user trust and transparency (von Engelhardt & Rußwinkel, 2024).

Alternatively, when the author names appear as part of the sentence, you can use a narrative citation, e.g., von Engelhardt and Rußwinkel (2024) argue that explanations are social and cognitive phenomena, not merely technical artefacts.

This section should also preview the contributions and summarise related work.

2. Background

The background section reviews theoretical and empirical work. Explicability can be seen as both an epistemic and ethical demand, ensuring that AI systems are understandable and accountable (Sievers, 2019). As Sievers (2019) points out, explicability requires an interplay between epistemic transparency and ethical responsibility.

3. Method

Describe participants, materials, procedure, and analysis. You can vary the names of the subsections, so that they fit best your structure and content.

3.1 Participants

State how many participants took part and relevant demographics.

3.2 Materials

Describe data, stimuli, or computational models used. It is good to have some illustrations of examples or the experimental setup. This could be a screenshot of the environment or a task analysis or some other flow chart to illustrate and clarify the procedure. You should refer to them in the text (see Figure 1).

Figure 1: Example figure showing model performance or outcomes. Every figure and table should include a well understandable figure caption that explains what is seen.

3.3 Procedure

Summarise the sequence of tasks or simulations.

3.4 Analysis

Specify methods of statistical or computational analysis.

4. Results

Present your main findings succinctly and refer to figures (see Figure 2) in the text where you should explain them.

Figure 2: Mean ratings of warmth, competence, and discomfort across the three participant groups in dependence on the robot's response time

You can also include tables if you want to present some numbers or other facts (see Table 1).

Table 1: Example of Participant Characteristics

Group	N	Mean Age (SD)
Experts	15	34.6 (5.2)
Novices	15	31.9 (6.1)

5. Discussion

Give a short summary of the key findings at the beginning. Interpret the results and relate them to prior literature. You should also include some new literature that you did not use yet. Discuss potential limitations and implications for future research.

For instance, models with transparent causal structures may enhance trust and accountability which is in line with (Rußwinkel et al., 2023).

6. Conclusion

Summarise the main insights and contributions of the paper.

Acknowledgements

You don't necessarily need acknowledgements but often some people who are not an author helped contributing to the work by giving feedback or money or supported in a different way. This could be stated here, e.g.: We thank our colleagues Nils Heinrich and Thomas Sievers for their helpful feedback and discussions.

Acknowledgments and bibliography are not included in the 6-page limit and may exceed that limit.
